For my digital portfolio I want to create a website. This website will showcase my work experience, accomplishments and other milestones. It will also showcase my education. I want to build a website instead of a resume or slideshow because it expresses exactly who I am. I can guarantee you, you can probably count on one hand how many students have submitted a website for this assignment to you. It's something I can use personally and not just throw away or delete once the semester ends. It's very easy to edit and has zero cost to maintain. A resume is also boring… everyone has a resume and they all state the same boring facts. My website will state the same boring facts but in a fun and creative way, a way that no one has really seen before, and if they have, definitely not many times. And you said no to slideshows.

I am going to code a website that uses custom animations, custom text, my own work and my own photos. The photo I'm most proud of is the shot of Lake Louise that is behind the concept map. Believe it or not, this was taken on an iPhone. It's not about the gear, it's all about the photographer. This was my first ever time at Lake Louise. I had been to Banff previously but never to the main lakes. Learning with my hands in the Motive Power program taught me feeling, and not emotionally. When you work with your hands you find out very quickly how a bolt snaps when wrenching on it, or what a tire feels like when it pops letting the last little bit of air out when mounting. It even teaches you what getting hurt feels like, smashing your knuckles while taking out a stuck brake caliper bracket bolt, or hitting your head off the bottom of an exhaust pipe. A book can only describe these things, and they honestly probably wouldn't even do that. Learning by doing is the best way of learning.

I am going to enlist the help of AI agents such as Claude and Gemini. They will be the physical coding brains behind the site, while I'll be overseeing everything they code, approving or denying their changes. I will be tossing them ideas such as a custom signature animation and text effects. Having AI agents like Claude write the code for me ensures that the website will be completed this millennium. Coding is one of the most difficult things to do in the world of computers. I can build a computer from just a box of parts and diagnose and fix one from just a report file, but when it comes to coding, nothing makes sense. Letting Claude handle that for me means fewer errors, and I can make the site more complex. I am still the brains behind it all: the ideas, photos, text, how it actually looks, how it feels when scrolling, how the viewer's eyes track the site. Claude just handles the code.

```
<svg class="signature" viewBox="0 0 400 120">
  <path d="M20 80 C60 10, 90 10, 120 70 S180 120, 220 50" />
</svg>
<style>
  .signature path { fill: none; stroke: #fff; stroke-width: 3; stroke-dasharray: 600;
animation: draw 3s ease forwards; }
  @keyframes draw { from { stroke-dashoffset: 600; } to { stroke-dashoffset: 0; } }
</style>
```

This is what HTML code looks like. It's very complex, and if I were to do it myself I'd need to have my grandkids submit it to the prof of 2090, because in total the website has over 1,000 lines of code, about 123,000 characters.

Here's a little taste of what the website will actually look like, my personal photography site.
